Ancestors_TreeType/TreeDr.cpp

```cpp
// Write a recursive TreeType member function called Ancestors that returns a string
// representing the ancestors (in reverse order) of a particular node whose info member contains value.
// Use the following signature:
// string TreeType<ItemType>::Ancestors(ItemType item) const
// NOTE the trailing const - it is part of the declaration in TreeType.h,
// and leaving it off will not match.
// Ivan Temesvari
// 3/11/2019

#include <iostream>
#include <fstream>
#include <string>
#include "TreeType.h"
using namespace std;

int main(){
    TreeType<string> tree;

    tree.PutItem("J");
    tree.PutItem("D");
    tree.PutItem("A");
    tree.PutItem("B");
    tree.PutItem("G");
    tree.PutItem("E");
    tree.PutItem("H");
    tree.PutItem("F");
    tree.PutItem("P");
    tree.PutItem("K");
    tree.PutItem("L");
    tree.PutItem("U");
    tree.PutItem("S");
    tree.PutItem("T");
    tree.PutItem("W");
    tree.PutItem("X");
    tree.PutItem("Y");

    cout << tree.Ancestors("T") << endl;
    return 0;
}
```
